

FEATURE ROADMAP

Excalidraw Export Badge · Group 8

Feature name: Excalidraw Export Badge

Team: Group 8 (Mitra Kermanian, Adedoyin Ahoton, Bertrand Cius, Jimmy Ong, Christian Douka)

Client: Avni Nahar, Head of Marketing, Excalidraw

Date: September 19, 2026

1. MILESTONES

What has to be true by the end of each build day.

Day	Date	What has to be true by the end of the day	Status
Day 15	Mon, Sep 21	The logo + “Made with excalidraw.com” badge appears in PNG and SVG exports from the Export window, bottom-right and below the drawing, never covering anything.	Not started
Day 16	Tue, Sep 22	The badge also appears in all 3 copy paths (Export window copy button, right-click Copy as PNG/SVG, and Shift+Alt+C). In SVG it’s a working link to excalidraw.com with campaign tags, clickable when the SVG is opened in a browser.	Not started
Day 17	Wed, Sep 23	One toggle in the Export window turns the badge on or off in both the preview and the file. It’s on by default and uses the existing label “Add ‘Made with Excalidraw’”, already translated in 57 languages.	Not started
Day 18	Thu, Sep 24	Tracking works: every copy path counts as an export, and each export records whether the badge was on or off (P0: this is how Avni’s Brand Visibility Rate gets measured). The badge is readable in dark mode and on transparent backgrounds.	Not started

Day 19	Fri, Sep 25	The P0 edge cases pass: tiny and huge diagrams, “Only selected”, custom backgrounds. The badge never appears in library thumbnails or other apps built on Excalidraw’s npm package (off by default there, on only on excalidraw.com).	Not started
Day 20	Mon, Sep 28	Tests pass, a demo is recorded, and a PR is opened (or the fork is live) with a note that PNG and clipboard images can’t be clickable.	Not started

2. RISKS & DEPENDENCIES

Risks

- Maintainers may say no. Excalidraw dropped its old watermark in the 2021 export redesign (PR #3613; leftover code removed in PR #3639) and never wrote down why. We plan around a demo on our own fork rather than a production merge.
- The badge could show up in the wrong places. Library thumbnails and other apps built on the npm package use the same export code, so the badge must sit behind a setting that is off by default outside excalidraw.com.
- People may switch it off. A one-click opt-out trades off against the Brand Visibility Rate: default-on use may drop as people discover the toggle.
- Not every export can be clicked. Only SVG can carry a real link; PNG and clipboard images are pictures. This is already reflected in the PRD’s requirements and appendix table.

Dependencies

- Avni: should the link go to excalidraw.com or to the marketing site (plus.excalidraw.com)?
- Head of Product: does Excalidraw’s analytics tool count visits that arrive with campaign tags (`utm_source=excalidraw&utm_medium=export`)?
- Core maintainers: a review of the export code changes, if we open a PR to Excalidraw.

3. WHAT WE’RE CUTTING FIRST IF WE RUN OUT OF TIME

Only P1 and P2 items from the PRD. P0 items, including analytics tracking and dark/transparent readability, are never cut.

Order	What we cut	PRD priority	What still works without it
1st	The compact badge for very small exports	P2	Small exports still get the normal badge.
2nd	Keeping a link when pasting into Google Docs or Notion	P2	Pasted images still show the badge and the address.
3rd	The badge comparison test with users (no badge / text only / logo + text)	P2	We launch the recommended version and learn from the keep rate.
4th	The badge growing at 2×/3× scale and on large diagrams	P1	The badge still appears; it may look small on very large images.
5th	Remembering the toggle choice in the browser	P1	The toggle still works; people switch it off each time.
